ABSTRACT

A system and method is provided for using a processing application to provide populated-form data to a reception device by populating unpopulated-form data with previously stored field data. In a preferred embodiment of the present invention, the

5 processing application is adapted to receive form-request data from a first reception device, where the form-request data corresponds to a first unpopulated-form data. The processing application then provides the first reception device with the first unpopulated-form data, which contains at least one field. The processing application is then adapted to receive at least one field data, where the at least one field data

10 corresponds to the at least one field contained within the first unpopulated-field data. Once the field data has been received, the processing application stores the field data in the database such that the field data is stored uncombined with the unpopulated-form data. The processing application is then adapted to receive form-request data and field-identification data from a second reception device (or the first reception device in a

15 subsequent session), where the form-request data corresponds to a second unpopulated-form data, and the field-identification data corresponds to one of the previously stored field data (e.g., the injured workers name or the claim/case number). Based upon this data (i.e., the form-request data and the field-identification data) the processing application will populate the fields within the second unpopulated-form data

20 with previously stored field data linked to the field data corresponding to the field-identification data. For example, the first or second reception device may provide the processing application with form-request data corresponding to an "affidavit form," and field-identification data corresponding to a claim number "1234." The processing application will then populate the fields within the "affidavit form" with previously stored

25 field data linked to the claim number "1234," which may include, for example, the name of the injured worker, the attorney for the injured worker, etc.
